

PORTFOLIO

work that *speaks for itself*.

brand voice, creative strategy, and the AI systems built to scale it.

COLLECTION I — BRAND VOICE

dreamcloud: website

Full site voice and copy for the DreamCloud brand under the Resident Home portfolio — refreshed for the DreamCloud 4 launch.

brand voice content writing copywriting

mayven: website

Brand voice development and full website copy for Mayven — defining a voice from scratch and implementing it cohesively across every page and flow.

brand voice copywriting ux writing

resident: anatomy of a brand voice guide

How I structure a brand voice guide to scale across multiple brands — the anatomy of the system, not the specific rules.

brand voice content strategy

COLLECTION II — COPY & CONTENT

mayven: newsletter flow

Four email flows built to drive engagement and conversions — from welcome to abandoned cart — each grounded in the brand voice and tailored to where the customer is in the journey.

copywriting

along.me: website copy

Brand voice and website copy for a B2B health app — built from scratch, written for two audiences at once.

brand voice copywriting

dreamcloud: what is a cloud bed?

A blog post for DreamCloud that does double duty — SEO content and brand storytelling, explaining the idea the brand's own name comes from.

brand voice content writing

nectar: best mattress by sleep position

A published SEO/AEO blog post for Nectar — structured to directly answer how side, back, stomach, and combo sleepers should each shop for a mattress.

COLLECTION III — AI & AUTOMATION

voice velma: brand voice infrastructure

problem: When I joined Resident, none of the four DTC sleep brands I write for had a defined voice — every team was guessing at tone independently, and anything that needed real brand judgment had to route through me directly, one request at a time.

approach: Built voice guides from scratch for each brand, then turned them into standalone Notion AI agents — one per brand — so any team member could write on-brand copy independently. Because it's built as a Notion AI agent, it integrates directly with the blog content agent and the knowledge base — all three draw from the same source of truth instead of operating as separate tools.

result: Personal productivity up 85%, and capacity freed up for everything that came after — the blog engine, the knowledge base automation, the landing page process. This is the system the rest of the work sits on top of.

ai automation

blog & content engine

problem: The blog was a contributing role, not an owned one — and when the SEO manager left, I inherited the whole thing with no process, no templates, and no clear handoff.

approach: Built brief templates, brand-specific voice guides for blog content, and an image-generation pipeline for on-brand illustrations, then closed the loop with Customer Insights and Customer Success so posts were grounded in real customer questions instead of guesswork. When a new SEO manager came on, we split it cleanly: I own the copy, the images, and posting; he owns topic generation and SEO strategy.

result: Consistently publishing 5+ posts a week without adding headcount — the templates and pipeline are what made that possible without sacrificing quality.

ai automation

knowledge base automation & product paula

problem: Product guides were scattered across Brandfolder, effectively unscannable — CS agents, the AI chatbot, and the product marketing team were all working from inconsistent information, and product marketing kept fielding the same basic questions over and over.

approach: Automated a Notion pipeline that takes product guide PDFs and generates structured pages for review — one internal version for CS agents, one external version feeding the AI chatbot — replacing the scattered documentation with one centralized, multi-tool system. Once that base existed, building Product Paula, a Notion AI agent connected to the full catalog, took about twenty minutes — a natural extension of infrastructure that was already there, not a separate project.

result: A single knowledge base now powers CS, the chatbot, and Paula. Paula had active users across multiple departments within two business days of launch.
